EASTMAN Fine Grain Duplicating Positive Film 2366

TECHNICAL DATA / BLACK-AND-WHITE INTERMEDIATE FILM

July 2015 • H-1-2366

EASTMAN Fine Grain Duplicating Positive Film 2366 (35mm) is a low-speed duplicating film intended for making master positives from black-and-white camera negatives which, when printed onto EASTMAN Fine Grain Duplicating Panchromatic Negative Film 2234 / ESTAR Base or EASTMAN Fine Grain Duplicating Panchromatic Negative Film 5234, produces duplicate negatives that are only distinguishable from the originals by skilled observers. This blue-sensitive black-and-white film has very high resolution and incorporates a yellow dye, which is removed during processing, to provide very high acutance.

BASE

2366 Film has a clear ESTAR safety base. The back side of the base contains an anti-static layer with a carnauba wax lubricant.

DARKROOM RECOMMENDATIONS

Handle unprocessed film in total darkness. If necessary, you can examine the film for *less than one minute*, using the following safelight combination: a 15-watt bulb and KODAK OC Safelight Filter (greenish-yellow), no closer than 1.2 metres (4 feet) to the film.

STORAGE

Store unexposed film at $55^{\circ}F$ ($13^{\circ}C$) or lower. For extended storage, store it at $0^{\circ}F$ ($-18^{\circ}C$) or below. Process exposed film promptly. Store processed film at $70^{\circ}F$ ($21^{\circ}C$) or lower at a relative humidity of 40 to 50 percent for normal commercial storage. For extended-term storage (for preservation of material having permanent value), store at $21^{\circ}C$ ($70^{\circ}F$) or lower, at a relative humidity of 20 to 50 percent.

Store processed film according to the recommendations in ISO 18911:2010, *Imaging Materials - Processed Safety Photographic Films - Storage Practices*.

EXPOSURE

For laboratories with subtractive printers, such as a Bell & Howell Model D Printer, these recommendations should be helpful as a starting point. Use a 500-watt tungsten lamp operating with a diffuser at a lamp setting of 75 volts. With a printer speed of 90 feet per minute and a diaphragm setting of 15, satisfactory master positives should be produced from original negatives of average density. (The maximum density of the negative image should produce a density of about 0.6 to 0.8 in the master positive, i.e., just above the lower end of the straight-line portion of the characteristic curve.)

IDENTIFICATION

After processing, the product code number 2366, emulsion and roll number identification, and internal product symbol (EX) are visible along the length of the film.

PROCESSING

The following process recommendations should be used as starting points for a typical continuous-immersion processing machine using formulas presented in KODAK Publication No.H-24.15, Manual for Processing EASTMAN Motion Picture Films, Module 15. The processing times may require modification for a particular machine.

Processing Step	Temperature	Time	Replenishment Rate (mL per 100 min)
KODAK Developer D-96*	70 +-0.5°F (21 +-0.3°C)	†	1,250 (D-96R)
Stop Rinse‡	70 +-2°F (21 +-1°C)	50 sec	12,000
KODAK Fixing Bath F-5*	70 +-2°F (21 +-1°C)	11 min	850
Wash (counter - current)	70 +-2°F (21 +-1°C)	10 min	12,000
Dry	95°F(35°C)	§	

- * Agitation in the developer and fixing bath should be by recirculation through submerged spray jets that impinge on the film strands.
- † Develop to recommended control gamma of 1.2 to 1.6.
- * Countercurrent flow of fixer-laden water overflow from the wash tank, pH about 6.
- § Many factors affect the drying: air temperature, relative humidity (RH); volume, rate and distribution of the air flow; final squeegeeing, etc.

In a conventional convection-type drying cabinet with air at about 95°F (35°C) and 40 to 50 percent RH, drying will take 15 to 20 minutes. With an impingement-type drying cabinet, however, with a higher temperature and lower RH, drying time is greatly reduced. With either type of dryer, the film should be dry without tackiness 1/2 to 2/3 of the way through. Upon cooling to room temperature after leaving the dryer, the film should be in equilibrium with the room air at approximately 50 percent RH.

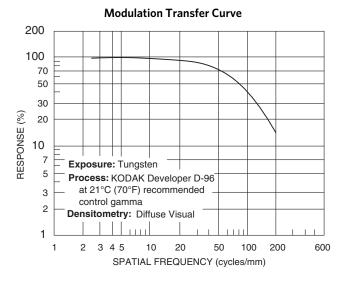

IMAGE STRUCTURE

The modulation-transfer curves, the diffuse rms granularity, and the resolving-power data were generated from samples of 2366 Film exposed with tungsten light and processed as recommended in Process D-96 at 70°F (21°C) to the recommended control gamma. For more information on image-structure characteristics, see KODAK Publication No H-845, The Essential Reference Guide for Filmmakers.

Diffuse RMS Granularity	9	
Resolving Power	100 lines/mm (TOC 1.6:1)	
	200 lines/mm (TOC 1000:1)	

^{*} Read at a net diffuse visual density of 1.0, using a 48-micrometre aperture.
† Determined according to a method similar to the one described in ISO 6328-1982, Photography—Photographic Materials—Determination of ISO Resolving Power.

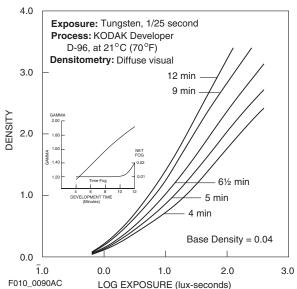

CURVES

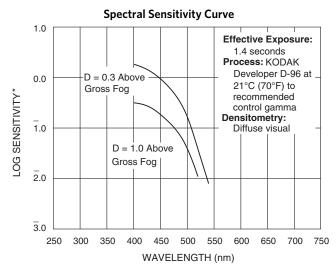

F010 0092AC

Note: These photographic modulation-transfer values were determined by using a method similar to the one described in ANSI Standard PH2.39-1977 (R1990). The film was exposed with the specified illuminant to spatially varying sinusoidal test patterns having an aerial image modulation of a nominal 60 percent at the image plane, with processing as indicated. In most cases, these photographic modulation-transfer values are influenced by development-adjacency effects and are not equivalent to the true optical modulation-transfer curve of the emulsion layer in the particular photographic product.

Characteristic Curves

EASTMAN Fine Grain Duplicating Positive Film 2366

 $\label{eq:seminor} \begin{tabular}{ll} *Sensitivity = reciprocal of exposure (ergs/cm^2) required \\ F010_0091AC & to produce specified density \\ \end{tabular}$

NOTICE: The sensitometric curves and data in this publication represent product tested under the conditions of exposure and processing specified. They are representative of production coatings, and therefore do not apply directly to a particular box or roll of photographic material. They do not represent standards or specifications that must be met by Eastman Kodak Company. The company reserves the right to change and improve

AVAILABLE ROLL LENGTHS

For information on film roll lengths, check Kodak's Professional Motion Imaging Price Catalog or see a Kodak sales representative in your country.
